BLOCK LOCK/LEVELER

BACKGROUND OF INVENTION:

FIELD OF THE INVENTION

Having been a tender for a mason, and laid block as a mason, I found no tool that Would ease fatigue on the back, keep gloves drier, or assist in leveling block without fumbling with one hand, to constantly adjust block and/or reach for a Level to square block horizontally and vertically. Having done block work for my dad and uncle, I decided to design a tool to make the task of block work easier and More efficient if I was going to be a mason, others saw my design and I decided to Make a prototype model. This tool also makes a substantial difference in the time it Takes to lay block. Being from Minnesota in cold weather, keeping gloves drier and laying block faster is a huge benefit in colder months and the added benefit of standing more upright helps to ease fatigue at the day's end.

DESCRIPTION OF RELATED ART

**Not applicable;
None that is known to applicant.**

SUMMARY OF INVENTION:

The invention herein illustrated is desired to be protected by a patent, and any improvements or changes in design or materials used protected, one of which is an add on feature still in prototype phase.

BLOCK LOCK/LEVELER TOOL

Replacement drawings:

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention will be understood more fully from the detailed description herein below and from accompanying drawings of the invention, which are given to explain invention only, and are not intended to limit the present invention.

In the drawings:

Fig. 1 is a schematic view showing tool unit set on chimney block showing related components of tool, same concept if block is corner or flat faced;

Fig. 2 is a schematic end/top view showing friction plate of tool and handle operation on webbed block, same concept if block is corner or rock faced;

Fig. 3 is a schematic side view of invention set on block without adjustment pin to show range of motion in inward or outward range of handle movement

Fig. 4 is a schematic top view of invention showing right and left halves.

Fig. 5 is a schematic side/end view of left side showing leveling plate and friction plate.

Fig. 6 is a schematic side view of right side showing adjuster pin hole and friction plate.

Fig. 7 is a schematic top view showing leveling system and tool range of motion.

Fig. 8 is a schematic view of handle assembly and adjustment holes.

DETAILED DESCRIPTION OF DRAWINGS:

Fig. 1 is a side view of invention set on chimney block (1) showing related components, the frame assembly(7) (11), initial adjustment is established by adjustment pin (13), then as handle (10) is raised, the friction plates grip sides of block, (2) (15) also stabilizer plates keep the block from any wobble effect (3) (14). The block can be leveled by horizontal/vertical level (9) on leveling plate(8) or by using the horizontal inset bubble level on frame (5). The block can be released by allowing less tension on handle, causing release spring (6) to push frame outward at points (4) and (13).

BLOCKLOCK/LEVELER TOOL

DETAILED DESCRIPTION OF DRAWINGS

Fig. 2 is a top/end view of invention set on regular 16" block this schematic shows handle movement (10), friction plate (2), the leveling system (5), (9), the block can then be transported or laid and block can be picked up in a vertical or horizontal position.

Fig. 3 is a schematic side view of invention showing related components as illustrated in figure 1, also shows the range of adjustment to varied block sizes from 15 ½ to 19 ¼". Frame assembly (7), (11), are made to slide into each other upon initial setup on block, adjustment pin (13), inserted then block can be carried, transported or laid without readjustment of pin, unless different block size is used. This schematic also shows the handle movement in relation to block the inward range is ¼ to 5/8" to keep friction plates tight on block sides and a outward range of ¼ to 3/8" to insure no disturbance of mud (mortar) joint on block while setting.

Fig. 4 is a top view of invention showing tool disassembled to show leveling system, and frame assembly which is split in right / left sides to better show range of invention in relation to varied block sizes.

Fig. 5 is a side/end view of left half of frame assembly showing the friction plate (2), the stabilizer plate (3), the leveling plate (8), attached horizontal/vertical bubble level (9), also shows the height of invention in relation to cement block which is 5 inches.

Fig. 6 is a side/end view of right half of frame assembly showing the friction plate (15), stabilizer plate (14), also shows height of invention in relation to cement block which is 5 inches.

Fig. 7 is a schematic top view of invention in relation to figure 1 showing inward/outward range of tool adjustment and shows leveling system.

Fig. 8 is a breakdown view of handle components in relation to figure 1 (10), Showing pivot points and adjustment hole location.
